# Glossary

## Test Categories

### Point of Care (POC)

POC tests require a Clinical Laboratory Improvement Amendments (CLIA) certificate to purchase and the test must be administered by a medical professional.

### Over the Counter (OTC)

OTC tests are self administered tests and are available to purchase without Clinical Laboratory Improvement Amendments (CLIA) or prescription license.

---

## Test Types

### Molecular

Molecular tests use specific probes to detect the presence of the genetic material of the novel coronavirus. To improve accuracy, many molecular tests can detect multiple viral genes instead of just one. Molecular tests are also known as PCR, NAAT, and LAMP and are the most specific tests.

### Rapid Antigen

Similar to the molecular test, the antigen test can be used to determine if you currently have COVID-19. It's possible that you'll also see this type of test referred to as a 'rapid test' and produce results within 15 to 30 minutes after the specimen is collected. Rapid Antigen tests are also very specific in results, however in comparison to Molecular tests, they are slightly less accurate.

### Antibody

Antibody tests can help determine if you've previously had COVID-19. You can also see this type of test called a serology test or a serological test. Antibody tests look for antibodies specific to the novel coronavirus in your blood. Antibodies are proteins that your immune system makes in response to infections or vaccinations. You can also refer to this type of test as a serology test or a serological test.

---

## Application Methods

### Nasopharyngeal Swab

A nasopharyngeal swab is a device used for collecting a sample of nasal secretions from the back of the nose and throat. This application is typically performed by a medical professional, inserted deep into the nasal cavity as the patient's head is tilted back and can be uncomfortable.

### Anterior Nasal Swab

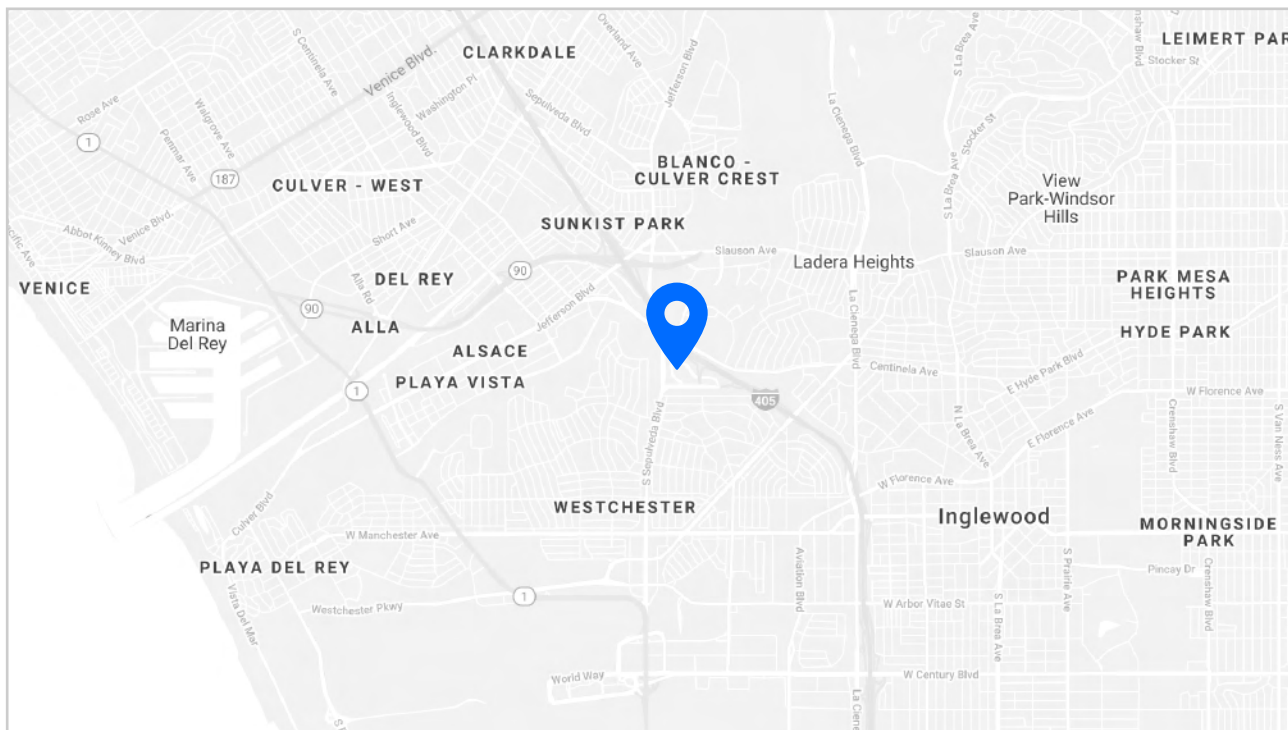

An Anterior Nasal swab is less invasive and results in less patient discomfort. This application can be performed by a medical professional or self-administered. It simply requires the lower nasal cavity to be swabbed in a circular motion around the nostril.

### Oral Swab

An Oral Swab takes place in the oral cavity including swabbing the interior cheeks, roof of mouth, tongue and gums. This application can be performed by a medical professional or self-administered. An oral swab usually requires 30 seconds of swabbing to accurately collect the specimen.
